

Syntax's Well-Architected Review Program

Capitalize on best practices to improve cloud performance, security and cost-effectiveness

Companies continue to move more and more processes and workloads to the cloud as they grow, evolve, and innovate. Yet in today's fast-paced, highly competitive business environment, companies often don't have the time or resources to ensure that their cloud infrastructure continues to meet current needs, or that they're using the best cloud services available. The result? Companies can't be sure the cloud infrastructure they rely on is as secure, high-performing, and cost-effective as it should be.

Make the Most of Your Cloud Investment with a Well-Architected Review

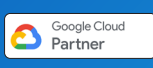

A Syntax Well-Architected Review helps companies identify the cloud architecture required to support a specific workload—and assess whether their deployed cloud architecture is aligned to those needs. No matter which hyperscaler a company uses—Amazon Web Services, Microsoft Azure, Google Cloud Platform or Oracle Cloud Infrastructure—a Syntax Well-Architected Review ensures a workload is designed for and runs on the latest cloud services, optimized to meet today's business requirements.

The Syntax Well-Architected Review Process

A Syntax Well-Architected Review is ideal for customers who have had a solution deployed in the cloud for a period of time. The length of time varies depending on the nature of the workload. For ERP systems, we recommend a review after at least one year in the cloud. For Native Cloud Solutions, like Kubernetes, we recommend a review after a minimum of six months in the cloud. Whatever solution or workload you're running, a Syntax Well-Architected Review is designed to deliver meaningful improvements with minimal disruption to your business.

- We don't just ask you to start by completing a Q&A form. Instead, we take a more personal approach, starting with a conversation with the workload's technical and application owners to help us gain a deeper understanding of your workload and business needs.
- We access the hyperscaler where the workload resides to assess your cloud architecture across six critical dimensions: operational excellence, security, cost optimization, reliability, performance efficiency, and sustainability.
- We prepare our findings and work with you to identify and prioritize next steps.
- We identify recommended mitigations—including procedures and security measures that support overall operational excellence. We'll execute some of these recommendations automatically and move forward with the rest at your discretion.

In some cases, hyperscalers offer funding programs to help you offset the costs of executing a Well-Architected Review.
